

Welcome to your CDP Water Security Questionnaire 2023

W0. Introduction

W0.1

(W0.1) Give a general description of and introduction to your organization.

Heidelberg Materials is one of the world's largest integrated manufacturers of building materials and solutions and operates on 5 continents. Our core products are cement, aggregates (sand, gravel, and crushed rock), ready-mixed concrete, and asphalt. The key business processes include extraction of raw materials and production of building materials, as well as their sales and distribution to the customers. Other services offered are sea worldwide trading, especially in cement and clinker. We operate 134 cement plants (plus 19 as part of joint ventures), over 600 quarries and aggregates pits, and around 1,430 ready-mixed concrete production sites worldwide. In total, we employ more than 51,000 people at around 3,000 locations in over 50 countries (plus over 350 production sites belonging to joint ventures). In 2022, the Group revenue amounted to 21.1 bill€).

At the centre of actions lies the responsibility for the environment. As front runner on the path to carbon-neutrality, Heidelberg Materials crafts material solutions for the future. With our new and global corporate brand Heidelberg Materials, we are giving our transformation a face and an anchor. At the same time, we remain true to the "Heidelberg" in our name – a 150-year legacy we build on a strong heritage, and "Materials", because we are taking a bold step towards the future.

In April 2023, we published our first combined report by providing in-depth information about both our financial development and our sustainability commitments. While doing so, we are considering reporting standards such as GRI, HGB, IFRS, SASB, CSRD and TCFD. Heidelberg Materials has committed itself to limiting the impact of its activities on the finite natural resource of water to the greatest possible extent. We comply with stringent environmental regulations to ensure that our raw material quarrying does not endanger local bodies of surface water or groundwater resources. Through conservation measures and efficient use, we want to conserve water and minimise negative effects. This can be achieved by using rainwater, utilising reuse, and recycling technologies, or working with local communities on water-related projects.

We regularly assess the proximity of our operational sites to protected areas and, if necessary, develop biodiversity management plans. For the "sustainable use and protection of water and marine resources" criterion, we have extended our existing approach of creating water management plans and make use of the assessment of (potential) risks and impacts carried out for this purpose. We aim to have water management plans in place by 2030 for all plants in regions affected by water scarcity, limited accessibility, poor water quality and climate-related physical water risks.

Our updated 2030 Sustainability Commitments

The United Nations Sustainable Development Goals (SDGs) shape our strategy and Sustainability Commitments. In February 2023, we published our updated 2030 Sustainability Commitments aiming at supporting our vision to build a more sustainable future that is:

1. Net zero: We drive the decarbonization of our sector and provide low-carbon products 2. Safe & inclusive: We place the health and wellbeing of employees, communities, and suppliers at the core of our business operations

3. Nature positive: We contribute to a nature positive world through our industry-leading biodiversity programme and sustainable water management

5. Circular & resilient: We drive circularity to reduce and reuse materials and natural resources

Sustainability Management

At Group level, the topic of sustainability has been organizationally combined under the umbrella of the Sustainability Office and the leadership of member of the Managing Board and Chief Sustainability Officer (CSO) since 2021. The CSO is the leading person in sustainability topics and is responsible for promoting and coordinating all sustainability activities. The CSO in collaboration with the Managing Board and consultation with the Supervisory Board drive the sustainability strategy. This structure, designed for cooperation and interdisciplinarity, is intended to ensure that sustainability criteria are incorporated into every decision taken at Heidelberg Materials. The departments of the Sustainability Office support the future-oriented sustainability activities at Group level. In addition to designing the sustainability strategy, including the associated targets, this includes in particular research and development of innovative materials and technologies. Our water expert in the ESG department focuses on the development of a group-wide strategic framework for water-related issues, including guidance on water reporting and management, on the implementation of the framework in the country organizations, on a set-up of efficient reporting structures and on the implementation of innovative pilot projects.

W-MM0.1a/W-CO0.1a

(W-MM0.1a/W-CO0.1a) Which activities in the metals and mining and coal sectors does your organization engage in?

Activity	Details of activity
Processing	Other ferrous metals processing, please specify
	Pig iron. The key business processes include extraction of raw materials and production of building materials, as well as their sales and distribution to the customers.

W0.2

(W0.2) State the start and end date of the year for which you are reporting data.

	Start date	End date
Reporting year	January 1, 2022	December 31, 2022

W0.3

(W0.3) Select the countries/areas in which you operate.

Albania Australia Bangladesh Belgium Benin Bosnia & Herzegovina Brunei Darussalam Bulgaria **Burkina Faso** Canada China Croatia Czechia Democratic Republic of the Congo Denmark Egypt Estonia France Gambia Georgia Germany Ghana Greece Hungary Iceland India Indonesia Israel Italy Kazakhstan Latvia Liberia Lithuania Malaysia Morocco Mozambique Netherlands Norway Poland Romania **Russian Federation** Singapore Slovakia

South Africa Spain Sweden Thailand Togo Turkey United Kingdom of Great Britain and Northern Ireland United Republic of Tanzania United States of America

W0.4

(W0.4) Select the currency used for all financial information disclosed throughout your response.

EUR

W0.5

(W0.5) Select the option that best describes the reporting boundary for companies, entities, or groups for which water impacts on your business are being reported.

Companies, entities or groups over which financial control is exercised

W0.6

(W0.6) Within this boundary, are there any geographies, facilities, water aspects, or other exclusions from your disclosure?

No

W0.7

(W0.7) Does your organization have an ISIN code or another unique identifier (e.g., Ticker, CUSIP, etc.)?

Indicate whether you are able to provide a unique identifier for your organization.	Provide your unique identifier
Yes, an ISIN code	ISIN DE0006047004

W1. Current state

W1.1

(W1.1) Rate the importance (current and future) of water quality and water quantity to the success of your business.

	Direct use importance rating	Indirect use importance rating	Please explain
Sufficient amounts of good quality freshwater available for use	Not very important	Neutral	The continuously growing demand for water worldwide is leading to global water stress due to competition for available water resources. Depending on the region, water quantity is as much an important aspect as quality. Since we do not depend on water in drinking water quality, we aim to reduce freshwater quantities by recycling water where possible. At our more than 3,000 production sites worldwide, Heidelberg Materials uses water for process conditioning, aggregates washing (especially for recycled aggregates), production of cement and concrete, grounds watering, cooling, and cleaning purposes. For the primary use in direct operations those processes however do not require high quality standards for water. Recycled water or rainwater collected through harvesting can be utilized to meet these water requirements. For indirect use we selected the importance rating "neutral", after considering suppliers and customers from various industry sectors for whom water plays a varying role. Suppliers: For the majority of our available machinery and equipment, high-quality fresh water is not required in large quantities. However, we are aware that suppliers of fuels, additives and further raw materials face different issues than providers of machines and equipment that has influence on the demand of water in good quality. Customer: Depending on the specific requirements for the characteristics of the concrete end product (such as strength, density, durability), the quality of water can play a more significant role.
Sufficient amounts of recycled, brackish and/or	Important	Neutral	With our Sustainability Commitments 2030, we have pledged to install recycling plants (includes rainwater harvesting) on all plants in water risk areas. We acknowledge that stress on water

produced water	resources is further exacerbated by the impacts of
available for use	climate change. Sufficient quantities of recycled,
	brackish, or produced water play a crucial role for
	direct operations and will continue to be significant
	in the future. Water is utilized at various stages of
	our production processes, including activities like
	washing gravel, sand, and recycled aggregates,
	equipment cooling, de-dusting, and cleaning
	transport vehicles. It also serves as a source
	material in concrete manufacturing and becomes
	integrated into the building material during
	production. Water is required for emission control
	systems, such as wet scrubbers, in cement
	production, particularly in older wet process kilns
	that are gradually being phased out to improve
	water efficiency. As a general rule, we therefore
	have the option of resorting to water recycling to
	reduce our environmental impact. However,
	availability of freshwater is not essential for our
	operations as many sites have access to
	significant water sources from the quarry that
	makes us water positive in certain areas where we
	provide water to external parties. Hence, we
	consider the direct use of water as important. We
	anticipate that this importance rating will remain
	unchanged in the future since we do not foresee
	significant alterations in the water usage for our
	production processes.
	Due to diverse supplier profiles and sector-specific
	water challenges, a universal statement on
	indirect water use is not feasible. Suppliers of
	fuels and additional raw materials may face
	different issues than equipment providers,
	resulting in a neutral rating for indirect use.
	However, this rating may change due to
	increasing global water scarcity, indicated by
	various scenario analyses potentially affecting
	suppliers' ability to meet our needs.

W1.2

(W1.2) Across all your operations, what proportion of the following water aspects are regularly measured and monitored?

Heidelberg Materials CDP Water Security Questionnaire 2023 10 August 2023

	% of	Frequency	Method of	Please explain
	sites/facilities/operation	of	measurement	
	5	t measuremen		
Water withdrawals – total volumes	% of sites/facilities/operation s	Frequency of measuremen t Monthly	Method of measurement We conduct monitoring of water withdrawals across all business lines. Aligned with the GCCA guidelines for water monitoring, we employ various methodologies , including measurement and estimation, to monitor water withdrawals at site level. We distinguish three ways of continuous water monitoring systems: (1) Measurement, (2) calculation by measurement and (3)	Please explain To ensure a comprehensive understanding of our water withdrawals, we utilize the indicators provided by the Global Cement and Concrete Association (GCCA). Recognizing the increasing scarcity of renewable water sources, particularly in specific regions, we understand the importance of proactive water management. Monitoring water usage is the initial step in effectively managing this vital resource. It allows us to identify areas for improvement and efficiency enhancements to reduce our water footprint. This includes activities such as identifying and addressing leaks, as well as benchmarking our operations against industry-leading practices to drive continuous improvement
			(2) calculation by measurement and (3)	operations against industry-leading practices to drive continuous improvement
			calculation by estimation. Measurement s are preferred as	of our water footprint. In general, all our sites are required to identify key areas of water withdrawal,
			they offer the most accurate and reliable methodology	consumption, discharge, and recycling, ensuring comprehensive management and

			for water accounting.	oversight of water resources as part of the
				(WMP).
Water withdrawals – volumes by source	100%	Monthly	Water withdrawals & volumes from our business lines are reviewed by our ESG department. Information about water sources & respective recordings are available for all sites. At each plant, we track sources of water withdrawals & destinations of water discharge. The majority of sites uses continuous water discharge. The majority of sites uses continuous water monitoring systems instead of periodic water monitoring. Every site has a water monitoring. Every site has a water monitoring plan containing information about the plant's water	Water Management Plan (WMP). Considering the increasing scarcity of renewable water sources, especially in certain regions, we recognize the importance of water monitoring as the initial step towards resource management. It allows us to identify potential areas for enhancing efficiency and reducing our water footprint, such as identifying leakages and benchmarking against best-in-class operations.
			sampling points,	

		estimated or	
		calculated.	
Entrained water associated with your metals & mining and/or coal sector activities - total volumes [only metals and mining and coal sectors]	Not relevant		Since we are not explicitly involved in mining activities, we do not measure the total volume of entrained water that is associated with it. Water used for dust suppression or further transportation purposes is reported and disclosed within the overall water withdrawal and consumption. In general, the water used for the washing of aggregates is not becoming entrained with any fine particles or other contaminants. Moreover, all sites need to comply with local and global regulations and permits, which foresee a proper treatment and disposal of the water being used in our business processes. Therefore, these parameters are not regularly measured and reported. As Heidelberg Materials business activities will stay the same, total volumes of entrained water associated with your metals & mining and/or coal sector activities remain unobjectionable.
withdrawals quality			primarily used for production and must

				meet comparatively low- quality standards for this purpose. In comparison, therefore, quantity is the decisive variable in the process. Therefore, we do not report data on quality of water withdrawn at Group level. However, on selected plants, water quality parameters are being measured if the source of withdrawal so requires. Since we usually purchase water that has already been pre-treated, further quality measurements are not required. Increased utilization of cross-industry water recycling systems might pose the need for more quality controls in the future. This development is closely monitored so that we can make adjustments if necessary.
Water discharges – total volumes	100%	Monthly	Water discharges & volumes from all business lines are reviewed by our ESG department. At each plant, we track volumes of discharged water and its destinations according to the GCCA	For the cement, aggregates, and ready- mixed concrete production process, water quantity is more important than quality to meet the operational requirements.Recognizin g the growing scarcity of renewable water sources, particularly in certain regions, we understand the importance of effective water management. Monitoring water usage

			Guidelines. We see a clear tendency towards water measurement devices on water discharges with priority to sites in water risk areas. The measurement is usually based on a flow meter or counter.	is the initial step in resource management and allows us to identify areas for efficiency improvement. This may involve detecting and addressing leakages, as well as identifying exemplary practices and benchmarking against industry leaders to enhance our water footprint.
Water discharges – volumes by destination	100%	Monthly	Water discharges and volumes from cement, aggregates, and concrete sites are reviewed by our ESG department. Data is consolidated at Group level annually. Information about water sources and respective recordings are available for all sites. At each plant, we track volumes of water discharges and destinations, following the guidelines	As we anticipate the increasing scarcity of renewable water sources, particularly in specific regions, we recognize the need for proactive measures. Water monitoring serves as the initial step in resource management, enabling us to identify areas for improvement and efficiency enhancement. Through this process, we can detect and address issues such as leakages and inefficiencies, while also learning from industry leaders and benchmarking against best-in-class operations. Our aim is to continuously improve our water footprint and contribute to sustainable water management practices.

			outlined in the "GCCA Sustainability Guidelines for water monitoring and reporting in cement manufacturing	
Water discharges – volumes by treatment method	76-99	Monthly	We ensure comprehensiv e monitoring of water discharges at our cement, aggregates, and ready- mixed concrete sites. Our ESG department consolidates data on volumes of water discharged by treatment method at Group level annually. We monitor the amount of water discharged to off-site water treatment facilities. On- site treatment facilities. On- site treatment methods are in general employed to address total suspended solids (TSS)	A portion of our discharge, consisting of natural minerals that are chemically inert, does not undergo treatment. These practices align with the GCCA Sustainability Guidelines for monitoring and reporting water in cement manufacturing. Recognizing the future scarcity of renewable water sources, particularly in certain areas, we prioritize water monitoring as a crucial step in resource management. This allows us to identify areas for efficiency enhancement, such as detecting and addressing leakages, and learning from industry leaders through benchmarking best-in-class operations. By taking these measures, we aim to continuously improve our water footprint and contribute to sustainable water management practices.

) Mater				
Water discharge quality – emissions to water (nitrates, phosphates, pesticides, and/or other priority substances)	Not relevant			In principle, our production processes do not release any water emissions, so it may be that random checks are required to verify that our water discharged is not contaminated with the listed emissions such as nitrates, phosphates, pesticides, and/or other priority substances - but this is the exception. In consideration of evolving water requirements, we are preparing to measure the quality of our discharge water and follow up on new developments that may arise through our expansion in the recycling business. Nevertheless, some regularly measured characteristics, such as temperature, ensure that the quality of our wastewater is safe. Although, we do not anticipate any changes within our business activities that could lead to a degradation of water quality, we expect increasingly stringent regulations and guidelines to ensure adequate water quality.

	2023.	addition to self-
		assessment, we have
		undertaken specific
		WASH-related actions at
		our operations in various
		countries, including
		India, Italy, and Thailand.
		These efforts
		demonstrate our
		commitment to improving
		WASH practices across
		our global operations.

W1.2b

(W1.2b) What are the total volumes of water withdrawn, discharged, and consumed across all your operations, how do they compare to the previous reporting year, and how are they forecasted to change?

	Volume (megaliters/ye ar)	Compariso n with previous reporting year	Primary reason for comparison with previous reporting year	Five- year foreca st	Primary reason for forecast	Please explain
Total withdrawal s	298,627	Lower	Increase/decrea se in efficiency	Lower	Increase/decrea se in efficiency	The reporting scope for 2022 year's disclosure covers Cement, Aggregates, and Ready- mixed concrete

			business
			lines. Within
			the same
			scope,
			Cement
			business
			line remains
			similar
			amount of
			Water
			Withdrawal
			- 60,730
			Megalitres
			in 2022
			compared
			to 60,261
			megalitres
			in 2021
			(increase of
			less than
			1%).
			Aggregates
			business
			line reduces
			almost
			12.8%
			amount of
			Water
			Withdrawal
			in 2022
			compared
			to 2021,
			due to the
			significant
			decreased
			groundwate
			r extraction
			in North
			America
			region.
			Ready-
			mixed
			concrete
			business
			line reduces
			3.8%

					amount of Water Withdrawal in 2022 compared to 2021, due to diminished Harvested Rainwater.
Total discharges	Lower	Increase/decrea se in efficiency	About the same	Increase/decrea se in efficiency	The reporting scope for 2022 year's disclosure covers Cement, Aggregates, and Ready- mixed concrete business lines. Within the same scope, Cement business line reduces less than 2% amount of Water Discharge from 29,500 Megalitres in 2021 to 28,950 Megalitres in 2021 to 28,950 Megalitres in 2021 to 28,950 Megalitres in 2022. Aggregates business line reduces 12 % amount of Water in 2022 compared

						to 2021, especially in Poland and North America. Ready mix concrete business line reduces 3.9% amount of Water Discharge in 2022 compared to 2021 mainly in run off / overflow.
Total consumpti on	69,279	Lower	Increase/decrea se in efficiency	Lower	Increase/decrea se in efficiency	We calculate consumptio n as total withdrawal - total discharge according to the GCCA Sustainabilit y Guidelines for water monitoring and reporting. We have been constantly working on improving water efficiency to decrease our specific water consumptio

			n per tonne
			of product.
			The result
			of Specific
			Water
			Consumptio
			n for
			Aggregates
			and Ready-
			mixed
			concrete
			have both
			demonstrat
			ed our
			water
			efficiency
			progress in
			2022
			compared
			to 2021.
			For
			example,
			specific
			Water
			Consumptio
			n for
			Ready-
			mixed
			concreate
			reached
			49.4 l/m³ in
			2022 from
			61.2 l/m³ in
			2021. In
			Cement
			business
			line, we
			remained
			similar
			amount of
			water
			consumptio
			n but higher
			Specific
			Water
			Consumptio

			n for
			Cement due
			to the
			reduced
			annual
			production
			volume in
			2022
			compared
			to 2021.

W1.2d

(W1.2d) Indicate whether water is withdrawn from areas with water stress, provide the proportion, how it compares with the previous reporting year, and how it is forecasted to change.

	Withdraw als are from areas with water stress	% withdra wn from areas with water stress	Comparis on with previous reporting year	Primary reason for comparis on with previous reporting year	Five- year foreca st	Primary reason for forecast	Identificati on tool	Please explain
Ro w 1	Yes	26-50	About the same	Other, please specify To have a holistic view of water risks, we broaden ed our scope from water scarcity to water risks.	Lower	Increase/decre ase in efficiency	WRI Aqueduct	In 2022, a similar proportion of water was withdrawn from water stressed areas compared to 2021. Our analysis of water stress utilizes the WRI Aqueduct tool, which defines water stress as

					the "ratio
					of demand
					for water
					by human
					society
					divided by
					available
					water"
					(WRI
					Aqueduct
					2015).
					Areas with
					high or
					extremely
					high water
					stress are
					considered
					water
					scarce. To
					assess
					water
					stress, we
					enter the
					geographic
					al
					coordinate
					s of our
					production
					sites into
					the tool to
					determine
					if they are
					located in
ļ					high or
					extremely
					high-water
					stress
					areas.
ļ					
					То
					calculate
					the
					percentage
					of water
					withdrawn
					from

				stressed
				areas, the
				water
				withdrawn
				from these
				sites is
				divided by
				the total
				water
				withdrawn
				from all
				sites. We
				employ the
				same
				methodolo
				gy for both
				2021 and
				2022 to
				ensure
				comparabil
				ity. It is
				worth
				noting that
				we did not
				make
				significant
				divestment
				s from or
				acquisition
				s of assets
				in water
				stressed
				areas
				relative to
				areas not
				under
				water
				stress,
				which
				contributed
				to the
				similar
				proportion.
				Several of
				our
				production

				sites, such
				as those in
				Egypt,
				Turkey,
				Belgium,
				and India.
				are
				situated in
				water
				stressed
				areas
				arcas.
				For the
				we
				extended
				the
				reporting
				scope. Io
				have a
				holistic
				view of
				water risks,
				we
				broadened
				our scope
				from water
				scarcity to
				include
				water risks,
				including
				not only
				regions
				where
				water
				availability
				is a
				problem.
				but also
				areas
				where
				water
				quality
				quality,
				ricke ord
				nsks and
				groundwat

				er
				depletion
				play a role
				and need
				to be
				addressed.
				. However,
				the
				percentage
				s of sites
				located in
				water
				scarcity for
				the
				individual
				husiness
				lines
				namely
				cement
				aggregates
				and
				ready-
				mixed
				concrete
				wore in e
				similar
				rango
				lange
				2021 and
				2021 anu 22% in
				2022)
				2022). Additionall
				y, there
				were no
				significant
				changes in
				assets
				located in
				water
				stressed
				areas
				compared
				to 2021.
				Therefore,
				we assume

				that the
				overall
				compariso
				n for the
				entire
				company
				remained
				relatively
				stable.

W1.2h

(W1.2h) Provide total water withdrawal data by source.

	Relevanc e	Volume (megaliters/year)	Compariso n with previous reporting year	Primary reason for comparison with previous reporting year	Please explain
Fresh surface water, including rainwater, water from wetlands, rivers, and lakes	Relevant	228,362	Higher	Increase/decreas e in efficiency	This includes 73,780 Megalitres Surface Water, 105,850 Megalitres Quarry Water Used, and 48,740 Megalitres Harvested Rainwater. It is relevant as we use part of our quarry water that accumulates, water from rivers or lakes and harvested rainwater for processes in our plants, like cooling, aggregates washing or cleaning. The

		total fresh
		surface water
		from Cement,
		Aggregates,
		and Ready-
		Mixed
		Concrete have
		increased by
		65.5% in 2022
		compared to
		2021 using
		the same
		reporting
		scope. More
		specifically,
		compared to
		2021, 2022
		figures
		showed
		Surface Water
		increased by
		52.4% due to
		significant
		increase in
		North America
		region and
		Netherlands
		within
		Aggregates
		business line;
		Quarry Water
		Used
		increased by
		62.4% where
		Cement and
		Aggregates
		business lines
		played major
		roles.
		Comparably,
		Aggregates
		had higher
		Quarry Water
		Withdrawal
		due to the
		some

					countries had higher volume in quarry water dewatering process such as Malaysia, North America region, and Czech Republic.
Brackish surface water/Seawater	Relevant	4,650	Lower	Increase/decreas e in efficiency	According to GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing which relevant for plants located by the sea, we have made progress by constantly making water efficiency efforts. Compared to 2021, we have reduced by 16% Brackish Surface Water Withdrawal in 2022 using alternative water sources, focusing on water recycling systems and enhancing efficient water

					management.
Groundwater – renewable	Relevant	47,980	Lower	Increase/decreas e in efficiency	We measureWe measurethis indicatorin accordancewith theGCCASustainabilityGuidelines forthe monitoringand reportingof water incementmanufacturing. Inaccordancewith theguidelines, wedo notdistinguishbetweenrenewableand non-renewablegroundwater.This metric isrelevant as weusegroundwaterat our sitese.g. forcoolingpurposes,aggregateswashing andconcreteproduction.Aggregatesbusiness linereduces byalmost 77%
					amount of Ground Water Withdrawal in 2022
					compared to

			2021, due to the significant decreased groundwater extraction in North America.
Groundwater – non-renewable	Not relevant		As per the GCCA Sustainability Guidelines for water monitoring and reporting in cement manufacturing , we do not differentiate between renewable and non- renewable groundwater sources. As defined by GCCA, groundwater includes on- site and off- site groundwater sources such as water from wells, boreholes, etc. without distinction between renewable and non-
Produced/Entraine d water	Not relevant		Following the GCCA Sustainability Guidelines for monitoring

					and reporting water in cement manufacturing , we do not track this withdrawal indicator as we do not withdraw any produced water for our operations.
Third party sources	Relevant	17,640	Higher	Increase/decreas e in efficiency	We measure this indicator in accordance with the GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing . This includes 9,860 megalitres of municipal water and 7,780 megalitres of external waste water. This indicator is relevant for us as we use municipal water for example for our sanitary facilities on site or for the production of concrete, and wastewater

			from other
			organizations
			in processes
			in the
			production
			plants, such
			as cooling.
			2022
			purchased
			municipal
			water volume
			has increased
			by 13.6%
			compared to
			2021. This is
			the result of
			denoting
			higher
			Aggregates
			business line
			Wastewater
			withdrawal
			from external
			organization
			(e.g. industry,
			agriculture)
			in 2022
			compared to
			2021.

W1.2i

(W1.2i) Provide total water discharge data by destination.

	Relevance	Volume (megaliters/year)	Comparison with previous reporting year	Primary reason for comparison with previous reporting year	Please explain
Fresh surface water	Relevant	198,359	Lower	Increase/decrease in efficiency	We measure this indicator in accordance with the GCCA Sustainability Guidelines for the monitoring and reporting of

					water in cement manufacturing. This discharge is relevant to us as we discharge water to fresh surface water sources, such as rivers or lakes, after the water has been used for instance for cooling in our cement plants or for aggregates washing. We've managed to reduce overall by 4.1 % amount of Fresh Surface Discharge in 2022 compared
Brackish	Relevant	12,320	Higher	Increase/decrease	We measure this
water/seawater				Intendency	accordance with
					the GCCA
					Sustainability
					the monitoring
					and reporting of
					water in cement
					manufacturing.
					This discharge is
					relevant to us as
					we discharge
					some of our
					in our plants that
					are by the sea,
					such as in
					Norway,
					Germany and the
					North America.
					In 2022, Canada
					has increased

				their Brackish Surface Water discharge whereas Germany and Norway have managed to decreased their Brackish Surface Water discharge volume together by 26.4%.
Groundwater Relev	vant 12,357	Higher	Increase/decrease in efficiency	We measure this indicator in accordance with the GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing. This discharge is relevant to us as we discharge some of our water to the groundwater after the water has been used for instance for cooling in our cement plants or for washing purposes in the aggregates business line. The result of the increase in Ground Water Discharge is reflected specially increased in Southern part of USA and

Third-party destinations Relevant 6,312 Higher Increase/decrease in efficiency This includes 1,157 megalitres discharged to site water Treatment facilities and 5,155 megalitres discharged to beneficial or other usage. As we discharged water to differen third-party destinations afte the water has been used e.g. for cooling in ou cement plants o in the aggregate production, measuring this indicator and the destinations is relevant to us. We measure it i accordance with the GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing. Compared to 2021, 2022 has reduced 4 megalitres wate						Canada, which is relevant to their region significant increase in Fresh Surface Water Withdrawal in 2022.
discharged to	Third-party destinations	Relevant	6,312	Higher	Increase/decrease in efficiency	This includes 1,157 megalitres discharged to off- site water treatment facilities and 5,155 megalitres discharged to beneficial or other usage. As we discharge water to different third-party destinations after the water has been used e.g. for cooling in our cement plants or in the aggregates production, measuring this indicator and the destinations is relevant to us. We measure it in accordance with the GCCA Sustainability Guidelines for the monitoring and reporting of water in cement manufacturing. Compared to 2021, 2022 has reduced 4 megalitres water that was discharged to

			third-party
			destinations and
			the volume has
			reduced by 10.6
			megalitres that
			was discharged
			to off-site water
			treatment
			facilities. The
			result reflects
			much lower
			water was
			discharged to
			beneficial or
			other usage in
			Aggregates
			business line in
			2022. We expect
			this metric to
			stay the same in
			line with both our
			water efficiency
			measures but
			also our efforts to
			provide water for
			beneficial use.

			samples are
			taken
			regularly
			and
			analysed in
			accordance
			with permit
			requirement
			S.
			The number
			of
			discharges
			with primary
			treatment
			remained
			relatively
			stable
			compared
			to 2021,
			considering
			the same
			volume of
			sites. This
			is due to the
			fact that our
			production
			processes

			and the
			number of
			sites
			operated
			have not
			changed
			significantly.
			In the
			future, we
			expect this
			value to
			remain
			constant or
			decrease
			due to the
			water
			efficiency
			measures
			implemente
			d at our
			sites.
			All plants
			must
			comply with
			the
			requirement
			s of their
			permit in
			relation to
			water,
			otherwise
			they may
			face
			penalties in
			terms of
			fines or the
			withdrawal
			of their
			license to
			operate. We
			also
			voluntarily
			follow the
			guidelines
			of

				Germany's
				global water
				strategy,
				which was
				adopted in
				March
				2023, as
				well as
				reporting
				and ISO
				standards
				In our new
				Water
				Policy
				2023, we
				also
				guidelines
				we adhere
				to, such as
				the CEO
				Water
				Mandate of
				the UN
				Global
				Compact.
Discharg	Not			We
e to the	relevant			discharge
natural				the
environm				collected
ent				water that is
without				not used for
treatment				production
uoumoni				processes
				directly into
				the natural
				onvironmon
				treatment.
				This
				practice is
				in line with
				the Global
				Cement and

			Association
			guidelines
			for cement
			production.
			Specifically,
			this is water
			from plant
			or quarry
			drainage
			that is not
			used for
			production
			processes,
			and
			rainwater,
			i.e.
			collected
			rainwater
			that is not
			used for
			production.
			In
			accordance
			with
			industry
			guidelines,
			we only
			record the
			volumes of
			water from
			quarry or
			mill
			drainage
			that are not
			used in the
			production
			process. It
			is important
			to note that
			this figure
			represents
			only a
			portion of
			the water
			P I

			into the
			natural
			environmen
			t without
			treatment,
			excluding
			rainwater.
			Therefore,
			the total
			amount is
			unknow.
			Going
			forward, we
			expect this
			figure to
			either
			remain the
			same or
			decrease
			due to the
			implementat
			ion of water
			efficiency
			measures
			at our sites.
			One of
			these
			measures is
			the use of
			water from
			rainwater
			harvesting
			and quarry
			drainage in
			our
			production
			processes,
			which would
			reduce the
			amount of
			rainwater
			and unused
			water from
			quarry/plant
			drainage
			that is

			discharged
			without
			being used
			on site.
			The figure
			only
			represents
			the data for
			our cement
			business
			line, which
			comprises
			ca. 50% of
			our
			revenues.
			As a matter
			of principle.
			all plants
			must
			comply with
			the
			requirement
			s of their
			permits with
			regard to
			water
			otherwise
			they face
			nenalties in
			the form of
			fines or the
			withdrawal
			of their
			permis. In
			rollow the
			guidelines
			of
			Germany's
			global water

W1.3

(W1.3) Provide a figure for your organization's total water withdrawal efficiency.

	Revenue	Total water withdrawal volume (megaliters)	Total water withdrawal efficiency	Anticipated forward trend
Row 1	21,095,000,000	281,700	74,884.6290379837	We expect the total water withdrawal efficiency to remain the same or decrease in the future in line with the water efficiency measures that we apply at our sites to increase water reuse and recycling, reduce water consumption, and thereby decrease the total water withdrawal volume.

W-MM1.3/W-CO1.3

(W-MM1.3/W-CO1.3) Do you calculate water intensity information for your metals and mining activities?

Yes

W-MM1.3a/W-CO1.3a

(W-MM1.3a/W-CO1.3a) For your top 5 products by revenue, provide the following intensity information associated with your metals and mining activities.

Product name	Numerator: Water aspect	Denominator	Comparison with previous reporting year	Please explain
Aggregates	Total water consumption	Ton of final product	Lower	Overall, there is one main reasons for a lower water intensity in the aggregates business line. Decisive is that the specific water consumption for aggregates decreased from 139.9 l/t in 2021 to 125.4 l/t in 2022 due to

	efficiencies and increasing water
	recycling systems which we further aim
	to implement as part of our
	Sustainability Commitments 2030
	strategy. This has already been
	indicated by the total water withdrawal
	for aggregates which declined from
	243.8 million m ³ (2021) to 195.6 (2022)
	million m ³ . This results in a smaller
	numerator. Although, less material has
	been produced in 2022 (18.4 billion
	tonnes) than in 2021 (18.9 billion
	tonnes) the reduction in water
	consumption (numerator) showed a
	greater change than the increase in
	product produced (denominator) having
	a positive impact on the water intensity.
	We work towards continuously reducing
	the total freshwater consumption which
	as one part of the water intensity can
	result in a lower result overall.

W1.4

(W1.4) Do any of your products contain substances classified as hazardous by a regulatory authority?

	Products contain hazardous substances	Comment
Row 1	No	As a manufacturer of building materials, we comply with the relevant regulations & standards on the safety and labelling of its products. The classification of substances as hazardous may vary depending on the respective regulatory authority, the intended use of the product and its actual ingredients through production processes. Also, certain cement- based products, may contain substances that can be classified as hazardous under certain circumstances. However, these substances are usually present in very low concentrations and are subject to strict regulations to ensure safe handling and use. We strive to provide clear and accurate information on the safe handling, storage, and disposal of its products through safety data sheets and product labelling. These materials are intended to help customers and users understand and manage the potential risks associated with the products.

W1.5

(W1.5) Do you engage with your value chain on water-related issues?

	Engagement
Suppliers	Yes
Other value chain partners (e.g., customers)	Yes

W1.5a

(W1.5a) Do you assess your suppliers according to their impact on water security?

Row 1

Assessment of supplier impact

Yes, we assess the impact of our suppliers

Considered in assessment

Supplier impacts on water quality Procurement spend

Number of suppliers identified as having a substantive impact

2,000

% of total suppliers identified as having a substantive impact

51-75

Please explain

As part of our risk assessment, we assess our suppliers based on ESG criteria. Water criteria focuses on impact of each commodity on water intensity& pollution. This is done to prioritize suppliers & focus on those with higher ESG risk. Each material category that is procured by us is measured by its impact on water as one of the environ. criteria that we are taking into account during initial risk assessments. We address identified high impact/risk suppliers representing +50% of global annual spend with our environ. assessment, which is supported by our partners "IntegrityNext" & "Avetta". We consider suppliers' position on water security positive & result substantive, if they can confirm that they don't cause harmful soil contamination, water & air pollution, harmful noise emission, or excessive water consumption which is affecting natural basis for the preservation/production of food, denying access to safe drinking water, impeding access to sanitary facilities, damaging health.

W1.5b

(W1.5b) Do your suppliers have to meet water-related requirements as part of your organization's purchasing process?

	Suppliers have to meet specific water-related requirements
Row 1	Yes, water-related requirements are included in our supplier contracts

W1.5c

(W1.5c) Provide details of the water-related requirements that suppliers have to meet as part of your organization's purchasing process, and the compliance measures in place.

Water-related requirement

Complying with going beyond water-related regulatory requirements

% of suppliers with a substantive impact required to comply with this waterrelated requirement

100%

% of suppliers with a substantive impact in compliance with this water-related requirement

51-75

Mechanisms for monitoring compliance with this water-related requirement

Grievance mechanism/Whistleblowing hotline Supplier self-assessment Supplier scorecard or rating

Response to supplier non-compliance with this water-related requirement Retain and engage

Comment

We include water-related requirements in our Supplier Code of Conduct whose principles have to be met by all suppliers. The importance of compliance with environmental standards that cover water rights, environmental impact on water, as well as access to drinking water is clearly communicated to all our suppliers through our Heidelberg Materials Supplier Code of Conduct. Based on this agreement, suppliers have to avoid or minimize environmental impacts that deny a person access to food, drinking water and sanitary facilities. In case of continued non-compliance of a supplier with this requirement Heidelberg Materials has the right to terminate the business relationship.

By % of suppliers with a substantive impact in compliance with this water-related requirement we refer to annual supplier spend.

Water-related requirement

Conducting water-related risk assessments on a regular basis (at least once annually)

% of suppliers with a substantive impact required to comply with this waterrelated requirement

100%

% of suppliers with a substantive impact in compliance with this water-related requirement

26-50

Mechanisms for monitoring compliance with this water-related requirement Grievance mechanism/Whistleblowing hotline

Supplier self-assessment Supplier scorecard or rating

Response to supplier non-compliance with this water-related requirement

Retain and engage

Comment

As part of our initial risk assessment, we assess material categories procured from our suppliers based on environmental and social criteria. Environmental criteria include but are not limited to water intensity, energy intensity, waste, biodiversity etc. The water criteria focus on the impact of each material category on water intensity & water pollution of processes. That way we are able to prioritize our suppliers and focus on those that deliver products/services with higher risk when it comes to environmental and social aspects.

Water-related assessments are part of our sustainability assessments that are performed by our sustainability partners "IntegrityNext" and "Avetta". By % of suppliers with a substantive impact in compliance with this water-related requirement we refer to annual supplier spend.

W1.5d

(W1.5d) Provide details of any other water-related supplier engagement activity.

Type of engagement

Information collection

Details of engagement

Collect information on water-related risks at least annually from suppliers

% of suppliers by number

1-25

% of suppliers with a substantive impact

51-75

Rationale for your engagement

We address the high risk/spend suppliers representing at least 50% of our global annual spend on environmental risks which includes a section on water management (see also answer to question 1.5a). This activity is supported by our sustainability partners "IntegrityNext" and "Avetta". Results and findings are displayed in our global supplier management and sourcing system. As central part of our procurement strategy and

policy we strongly communicate our approach to a more sustainable supply chain in key supplier meetings.

Impact of the engagement and measures of success

As part of our Responsible Procurement program, we engage with our high risk/impact suppliers on environmental topics by e.g., running annual virtual supplier days, including sustainability standards in regular supplier meetings, providing suppliers with free-ofcharge online sustainability trainings, and including the results of environmental assessments in supplier-profiles of our global sourcing system so procurement teams can use them for sourcing decisions.

We consider suppliers' position on water security positive, if they can confirm that the company is not causing harmful soil contamination, water & air pollution, harmful noise emission, or excessive water consumption which is:

a) significantly affecting the natural basis for the preservation and production of food,b) denying a person access to safe drinking water,

c) impeding or destroying a person's access to sanitary facilities, or

d) damaging a person's health

Findings of suppliers' environmental behaviour (including water) are gathered as part of our "Responsible Procurement" program and are automatically included and displayed as part of the supplier ESG profile in our global supplier management system.

It is extremely important and valuable for us to ensure that information is exchanged reliably at all levels of their supply chain. Trusting partnerships based on full transparency help us to achieve seamless cooperation and sustainable operational performance.

Comment

Heidelberg Materials takes a commendable approach to address high-risk suppliers and water management in its sustainability efforts. We collaborate with partners, integrate findings into our global supplier management system, and emphasize sustainability in supplier meetings. This demonstrates our commitment to a sustainable supply chain and proactive environmental risk management.

Type of engagement

Incentivization

Details of engagement

Water management and stewardship is featured in supplier awards scheme

% of suppliers by number

1-25

% of suppliers with a substantive impact 51-75

Rationale for your engagement

We work together with our sustainability partners "IntegrityNext" and "Avetta" to increase the transparency of our supplier base. Results and findings are displayed in our global supplier management and sourcing system. As central part of our procurement strategy and policy we strongly communicate our approach to a more sustainable supply chain in key supplier meetings.

Impact of the engagement and measures of success

Findings of suppliers 'environmental behaviour (including water) are displayed as part of the supplier ESG profile in our global supplier management system. As per procurement policy, buyers are required to take the information of this ESG profile into account when inviting suppliers to tenders and as part of the decision-making process. As a result of this approach, suppliers are incentivized to improve their status on water management as it increases the likelihood of gaining a better position in the tendering process.

Comment

Heidelberg Materials collaborates with sustainability partners to increase supplier transparency. Results are displayed in our global supplier management system, and sustainability is emphasized in supplier meetings. This approach incentivizes suppliers to improve their water management practices. Overall, it showcases the company's commitment to sustainability and driving positive change in the supply chain.

W1.5e

(W1.5e) Provide details of any water-related engagement activity with customers or other value chain partners.

Type of stakeholder

Customers

Type of engagement

Education / information sharing

Details of engagement

Run an engagement campaign to educate stakeholders about your water-related performance and strategy

Rationale for your engagement

In 2022, we implemented our Sustainability Maturity Tracker (SMT) across all participating countries. SMT serves as an instrument enabling us to evaluate our customers' sustainability progress. This insight empowers us to devise strategies for expanding our sustainable portfolio and educating the market. With this knowledge, we can deliver personalized and tailored solutions that effectively address unique requirements of each customer. The SMT enables us to focus our efforts on specific customer segments that are ready to collaborate with us on initiatives, as well as those who are open to initiating conversations about sustainability. Investing early in educating these customers who are less mature in their sustainability journey is a wise decision. It positions us as experts in the field, solidifies our reputation as a leading sustainable

brand, and ensures a revenue stream as they continue to grow. Additionally, in 2022, we made significant strides in communicating with customers on sustainability topics through webinars, events, and dedicated software apps. These creative endeavours reinforce our position as pioneers in building a sustainable future.

Examples:

Examples of our efforts include identifying opportunities for improvement in a ready mixed concrete plant, resulting in cost reduction and decreased water consumption. Another example involves a Czech Republic aggregates plant that successfully reduced water consumption through changes in material washing methods.

Impact of the engagement and measures of success

This engagement allows us to better understand where our customers are in their sustainability journey and to track how they mature over time. Given the information Heidelberg Materials can provide more personalised and tailored solutions, addressing unique requirements effectively. We aim for an early education on sustainability for a common ground. By qualitatively analysing our customer's standing we already receive valuable insides. By observing the behaviour of the individuals who have undergone the sustainability education program we can assess the impact and potential success. This may include a focus on changes in their daily practices related to sustainability, such as water recycling or reduction. Also, our success can be measured by repeated participation in the educational programs and the interest raised in water issues, which in turn could trigger changes in daily operations.

W2. Business impacts

W2.1

(W2.1) Has your organization experienced any detrimental water-related impacts? No

W2.2

(W2.2) In the reporting year, was your organization subject to any fines, enforcement orders, and/or other penalties for water-related regulatory violations?

	Water-related regulatory violations	Comment
Row	No	In the reporting year 2022, we had no water-related fines,
1		enforcement orders and/or other penalties for water-related regulatory
		violations.

W3. Procedures

W3.1

(W3.1) Does your organization identify and classify potential water pollutants associated with its activities that could have a detrimental impact on water ecosystems or human health?

	Identification and classification of potential water pollutants	How potential water pollutants are identified and classified
Row 1	Yes, we identify and classify our potential water pollutants	We systematically identify and classify potential water pollutants. Local (governmental) regulations in place that determine the permissible limits of pollutants in water and provide guidelines as well as standards for water quality. In addition, a stakeholder analysis and a risk assessment are carried out as part of the water management plans. Potential environmental risks, including water risks, are taken into account as also requested by the Group's globally applicable policy which addresses water quality and requires minimizing the environmental impacts of water discharges. Adherence to permits and ISO 14001 certification ensures for all sites and business activities that potential pollutants are identified and treated appropriately. Control is carefully executed on plant level and by the responsible regulatory authority. In general, water quality is tested in external laboratories by taking various water samples. In addition, there are direct measures that check the temperature on site, for example, depending on the monitoring and reporting requirements.

W3.1a

(W3.1a) Describe how your organization minimizes the adverse impacts of potential water pollutants on water ecosystems or human health associated with your activities.

Water pollutant category Pesticides

Description of water pollutant and potential impacts

It is very uncommon that we face water quality related challenges since our production processes are well managed and do not pollute the water. However, groundwater, which we also partly use may carry some contamination originating from external sources,

e.g., agricultural activities. Apart from very specific cases our extraction and processing activities do not lead to nitrate, phosphate, or pesticides emissions. In the very specific case when using imported materials extracted from tunnels, washing the material may require nitrogen management. This is related to the nitrogen inherent to the use of explosive. Nevertheless, the topic is relevant at less than 1 % of our sites.

Value chain stage

Direct operations

Actions and procedures to minimize adverse impacts

Water recycling Requirement for suppliers to comply with regulatory requirements Discharge treatment using sector-specific processes to ensure compliance with regulatory requirements Other, please specify Integrated Water Resource Management

Please explain

Water recycling plays an important role since it allows for the treatment and reuse of wastewater and other water sources. This prevents the discharge of pollutants into natural water bodies. Moreover, freshwater can be preserved, minimizes the need for further water withdrawals which thereby maintains ecological balance and reduces impact on ecosystem and human health. By ensuring and maintaining high water quality through recycling systems the risks on human health are further minimized. In consideration of the supply chain act and the upcoming challenges in relation to fresh water, it is essential to involve the suppliers. Involving our suppliers in a responsible water management will be reflected in collaborations on reducing water consumption and addressing water-related challenges. Also, suppliers' compliance with guidelines are an indicator for successfully measuring and evaluating accountability. Holding suppliers accountable establishes a framework for responsible and sustainable water recycling practices, ensuring proper management of potential water pollutants. Our Integrated Water Resource Management (IWRM) promotes comprehensive planning and coordination of water sources as well as protection and pollution prevention. Also, the involvement and engagement with further stakeholders beyond suppliers can promote finding appropriate mitigation measures.

W3.3

(W3.3) Does your organization undertake a water-related risk assessment?

Yes, water-related risks are assessed

Comment

As part of our comprehensive risk management approach, we conduct a thorough assessment of potential and actual water risks faced by Heidelberg Materials. Prior to establishing new operations, we conduct both environmental and conventional business assessments. Additionally, we utilize the WRI Aqueduct tool to assess water-related risks in our operations, providing insights into current river basin conditions and future scenarios. This risk assessment is conducted for all our facilities. When assessing the different water regions, care was taken to ensure that the focus was not only on water scarcity but also on water risk. Recently, physical water risks, water quality and groundwater depletion have also been taken into account. Water scarcity, water stress and water risk were prioritized.

In line with the Task Force on Climate-related Financial Disclosures (TCFD) methodology, we have individually rated each of our global operations based on their exposure to key acute and chronic risks, including water-related risks such as flooding, drought, and extreme precipitation. To evaluate different climate scenarios and time horizons, we employ a global modelling software developed by a leading insurance company. Furthermore, we utilize the WBCSD WASH Pledge Self-Assessment tool to assess risks related to access to safe water, sanitation, and hygiene for our global workforce.

To ensure a decentralized approach, risks are identified by country management and reported to the Managing Board on a quarterly basis. This reporting encompasses water-related risks within our own operations, as well as supply chain and customer market disruptions. It takes into account regulatory, physical, and transition implications.

W3.3b

(W3.3b) Describe your organization's process for identifying, assessing, and responding to water-related risks within your direct operations and other stages of your value chain.

W4. Risks and opportunities

W4.1

(W4.1) Have you identified any inherent water-related risks with the potential to have a substantive financial or strategic impact on your business?

No

W4.1a

(W4.1a) How does your organization define substantive financial or strategic impact on your business?

At Heidelberg Materials, we consider events that may have a negative impact on the achievement of short-term and long-term operational and strategic corporate targets to be risks.

We distinguish between quantitative and qualitative risks. For short term quantitative risks (next 12 months), we consider an impact on the key parameters "Results from current operations ", "profit for the financial year "or "cash flow "as significant for the Group if > EUR 120 million. For mid- to long term risks of strategic nature, we consider an impact of EUR 300 million as significant. Those impacts thresholds were defined as tolerance limits in relation to current Group's EBITDA.

While we strive for quantification of all risks, specific risks such as reputation risk are of qualitative nature. The potential extent of damage of non-financial risks is assessed according to qualitative criteria from low to critical in a top-down approach based on specific loss scenarios that could trigger the event. Those risks might represent a threat to our business

model requiring a shift or adjustment in activity in the future and are therefore might also be considered as significant. Most of the transition risks are of qualitative nature.

Note: Please note that the term substantive financial risk in this CDP questionnaire refers to inherent, or gross risks, while we are required in Germany to assess our risks from a Net perspective. The impacts mentioned above are therefore Net Impacts. All risks to direct operations as well as other parts of the value chain are assessed, including extreme weather scenarios such as flood or droughts. As water is required in several steps of the cement, aggregates and ready-mixed concrete production process, droughts or water scarcity could pose a risk to our operations and lead to damages to our production sites, interrupt the supply to our customers or have adverse effects on the supply of upstream products to our operating units. However, with the quarry providing a significant source of water at many sites, this risk is mitigated.

W4.2b

(W4.2b) Why does your organization not consider itself exposed to water risks in its direct operations with the potential to have a substantive financial or strategic impact?

	Primary reason	Please explain
Row 1	Risks exist, but no substantive impact anticipated	We recognize the presence of water risks at the local level within our direct operations. These risks encompass not only water scarcity but also potential physical challenges such as flooding and regulatory constraints. For example, certain production sites in Turkey, Kazakhstan, Italy, and France are located in water-risk areas where water scarcity may become a future concern. In countries like Australia or Bangladesh, which are located near the sea, extreme weather conditions could lead to flooding and disrupt the production process. Heavy rainfall, groundwater table decline, or the risk of drought can also pose a challenge.
		We are fully aware of these risks and consider them in our assessments. We take appropriate measures, if necessary, to address them. These measures may include a gradual implementation of water management plans, water recycling systems and further proactive steps like storing critical materials at higher ground within the facility. It is important to note that our global portfolio of operations is highly diversified, encompassing 3000 cement production sites, quarries, and aggregates pits, as well as ready-mixed concrete production sites worldwide. As a result, any adverse impacts would likely affect less than 1% of our production facilities, which falls below the threshold for substantive risk as defined in our risk catalogue. Recognizing that water-related challenges are inherently local and vary
		across regions, we anticipate that the diversified nature of our production facilities will prevent any substantial impact on Heidelberg Materials at the

group level. This assessment takes into account our definition of
substantive risk as outlined in our risk catalogue.

W4.2c

(W4.2c) Why does your organization not consider itself exposed to water risks in its value chain (beyond direct operations) with the potential to have a substantive financial or strategic impact?

	Primary reason	Please explain
Row 1	Risks exist, but no substantive impact anticipated	Considering our risk assessments within the ESG department as well as within the Risk Management department, Heidelberg Materials has not encountered any significant risks within its supply chain. We have observed that suppliers of fuels, blast-furnace slag, and other materials have not faced, nor are they expected to face, substantial detrimental impacts related to water risks. It is worth noting that our suppliers come from various industry sectors, each with different levels of water involvement. For example, suppliers of fuels and raw materials may encounter different challenges compared to equipment providers. It therefore tends to be unlikely that all suppliers will face a water crisis that is so severe that it will have a substantial financial or strategic impact on Heidelberg Materials at the same time. However, the risk may exist.
		risks in the supply chain will not have a significant impact on our operations, considering the assessed importance of water and the diverse range of suppliers we engage with.

W4.3

(W4.3) Have you identified any water-related opportunities with the potential to have a substantive financial or strategic impact on your business?

Yes, we have identified opportunities, and some/all are being realized

W4.3a

(W4.3a) Provide details of opportunities currently being realized that could have a substantive financial or strategic impact on your business.

Type of opportunity Products and services

Primary water-related opportunity

Increased sales of existing products/services

Company-specific description & strategy to realize opportunity

Situation: As the frequency and intensity of extreme weather events and natural disasters increase due to climate change, there is a growing demand for resilient infrastructure solutions to mitigate their devastating consequences.

Task: We recognize this as a business opportunity, as we provide such solutions in over 50 countries worldwide. By adapting to the changing climate parameters, we can capitalize on the demand for climate change adaptation products and contribute to revenue growth while offering essential infrastructure solutions, e.g. in Italy where climate change attributed prominent flood disasters have occurred in recent years.

Action: To realize this opportunity, we have expanded our product portfolio to include specialized offerings designed for flood protection and climate resilience. These products cater to various applications, including flood barriers, protective structures, hydraulic works, coastal defences, sustainable urban drainage systems, and water conservation and management in dams and reservoirs. Our innovative product i.idro DRAIN features a unique concrete formulation for floors with exceptional drainage capacity. Its carefully selected aggregate size and air entrainment agent enable it to achieve a draining capacity 100 times higher than that of silt and clay. This product allows for the creation of functional pavements that enhance non-motorized and sustainable transportation, providing improved regularity, traction, and water permeability. It helps prevent slippery surfaces and eliminates gaps between tiles or stone elements by utilizing a continuous water-permeable concrete surface.

Timeline: In June 2022, a new cycle path in i.idro DRAIN was completed in collaboration with the Infrastructure Department of the Metropolitan City of Milan. Such projects underline the performance and suitability of this product. In line with our sustainability ambitions 2030, we will consider areas in which the marketing of i.idro DRAIN makes sense and has positive value, taking into account water risk factors.

Results: By offering these specialized solutions, we actively address the demand for climate change adaptation measures, contributing to the creation of resilient infrastructure & seizing opportunities for revenue growth. Our commitment to providing sustainable infrastructure solutions aligns with the global need for climate resilience and positions us as a trusted partner in combating the challenges posed by climate change.

Estimated timeframe for realization

More than 6 years

Magnitude of potential financial impact

High

Are you able to provide a potential financial impact figure?

Yes, a single figure estimate

Heidelberg Materials CDP Water Security Questionnaire 2023 10 August 2023

Potential financial impact figure (currency)

6,300,000,000

Potential financial impact figure - minimum (currency)

Potential financial impact figure - maximum (currency)

Explanation of financial impact

We expect a growth in the quantity demand of sustainable products and concrete for building resilient infrastructures to adapt to climate change within the next decade or two. Our aim is that 50% of our total revenue is coming from sustainable products and applications.

Currently our sustainable revenue is 34% of total revenue of 21.095 m€. This translates to ca. 7.200 m€. In our target year 2030, we expect, due to inflation and GDP growth that our total revenue will reach 27.000 m€. If we meet our 50% goal, sustainable revenue would therefore be 13.500 m€ in 2030. The difference of additional sustainable products and applications is thus 6.300 m€.

Cost calculation: Current group Revenue (21.095) * GDP Growth & Inflation until 2030 = Total Revenue 2030 (27.000 m€)

Sustainable Revenue 2030 (= 50% of total revenue = 13.500) – current sustainable revenue (=34%* 21.095) = 6.300 m€

W6.2

(W6.2) Is there board level oversight of water-related issues within your organization? $$_{\mbox{Yes}}$$

W6.2a

(W6.2a) Identify the position(s) (do not include any names) of the individual(s) on the board with responsibility for water-related issues.

Position of individual or committee	Responsibilities for water-related issues
Chief Sustainability Officer (CSO)	The Chief Sustainability Officer (CSO) at Heidelberg Materials is a member of the Managing Board which underlines how deeply rooted sustainability (and therein water) is in our company. The CSO holds direct responsibility for all Environmental Social Governance (ESG) matters, including the water management. The CSO is in regular (bi-weekly) exchange with the Vice President (VP) of the ESG department and involved in every decision-making process. The CSO plays a key role in formulating the group-wide water strategy, including setting targets, KPIs, and measures, policies, and guidelines, and oversees their implementation. In 2022, the water policy was written in close collaboration with the CSO. Delivering on our ambitions also involves a strong network, so our CSO also signs partnerships with initiatives, such as our membership in the Global Water Partnership (GWP). This ensures the exchange with key stakeholders as an element of influence on our corporate sustainability strategy. Further, water in the context of sustainability related issues is part of our Due Diligence Process of acquisitions and is considered in other strategically relevant questions of or business.

W6.2b

(W6.2b) Provide further details on the board's oversight of water-related issues.

Frequency that water-related issues are a scheduled agenda item	Governance mechanisms into which water-related issues are integrated	Please explain
agenda item	integrated	

Row	Scheduled -	Monitoring	The Chief Sustainability Officer (CSO) at Heidelberg
1	some meetings	implementation and	Materials holds a comprehensive role in overseeing
		performance	all ESG-related matters, including water
		Monitoring progress	management, and possesses a broad
		towards corporate	understanding of sustainability issues across
		targets	various domains.
		Overseeing acquisitions, mergers, and divestitures Overseeing and guiding public policy engagement Overseeing major capital expenditures Overseeing the setting of corporate targets Providing employee incentives Reviewing and guiding annual budgets	Bi-weekly meetings are held with the VP of the ESG (Environmental Social Governance) department and the ESG team (monthly) including the responsible water manager, where water-related topics are discussed, among other things. Part of the Sustainability Commitments 2030 is a strong commitment on water, the implementation and progress of which are tracked in these meetings and reported in board meetings through the CSO on a regular basis. At the same time, area board members follow up on the implementation of the sustainability commitments at country level together with the business managers during quarterly management meetings, including allocated budgets and business plans. Current events that may be related to water are also discussed at the monthly board meeting
		guiding business plans Reviewing and guiding corporate responsibility strategy Reviewing and guiding major plans of action Reviewing and guiding risk management policies Reviewing and guiding strategy Reviewing innovation/R&D priorities Setting performance objectives	The Heads of Competence Centres for our operations inform the Board, for example, on water issues related to cement, aggregates and ready- mixed concrete production, water-related due diligence for acquisitions, and innovation reviews, while the VP of ESG updates the Managing Board on water policy issues and the implementation of Group-wide water targets and KPIs and the corporate sustainability strategy. General Managers inform the Board on plant- and country-specific water matters, for example water-related impacts on production or sales in a specific country.

W6.2d

(W6.2d) Does your organization have at least one board member with competence on water-related issues?

	Board member(s) have competence on water-related issues	Criteria used to assess competence of board member(s) on water- related issues
Row 1	Yes	The CSO, who is responsible for all ESG-related topics, has a holistic overview of sustainability topics at Heidelberg Materials, including water, and has detailed knowledge of the individual topics. This is assessed on the basis of academic training in environmental sciences, natural sciences, ecology or similar and/or previous professional experience in sustainability management with various environmental aspects. In addition, the CSO is in direct close contact with the water manager, who works with country-specific water experts. In addition, the Managing Board members responsible for our various business units have in-depth knowledge of technological advances, e.g., in the introduction of water-saving technologies, and of the local conditions in which we operate, e.g., in areas with water scarcity or other water related risk factors, as well as the legal environment in the respective country. Our water experts have the educational background and professional experience that is further supported by trainings. Through our partnerships and networks, for example with the Global Water Partnership, regular exchange and knowledge transfer with key external stakeholders is ensured.

W6.3

(W6.3) Provide the highest management-level position(s) or committee(s) with responsibility for water-related issues (do not include the names of individuals).

Name of the position(s) and/or committee(s)

Chief Sustainability Officer (CSO)

Water-related responsibilities of this position

Assessing future trends in water demand Setting water-related corporate targets Monitoring progress against water-related corporate targets Integrating water-related issues into business strategy Managing major capital and/or operational expenditures related to low water impact products or services (including R&D) Managing water-related acquisitions, mergers, and divestitures

Frequency of reporting to the board on water-related issues

More frequently than quarterly

Please explain

The CSO and ESG department are responsible for the management of water, including the implementing water-related strategies, monitoring progress toward goals via tangible key performance indicators, and supporting operational efforts in the area of water management. The CSO and ESG stay informed about latest trends and discussions on water, also through exchange with key external stakeholders. The CSO submits regular reports on water-related issues, to the Managing Board: These reports cover a range of topics, e.g. internal & external developments, risks & policy discussions, benchmarking, progress toward water-related targets, KPIs, and respective measures. The CSO enables the exchange within the Sustainability Office and its underlying departments through monthly meetings. External representation of water-related topics in context of sustainability takes place through participation in global events, on conferences, political discussions, COP etc.

Name of the position(s) and/or committee(s)

Other, please specify Vice President ESG

Water-related responsibilities of this position

Assessing future trends in water demand Managing water-related risks and opportunities Setting water-related corporate targets Monitoring progress against water-related corporate targets Managing public policy engagement that may impact water security Integrating water-related issues into business strategy Providing water-related employee incentives

Frequency of reporting to the board on water-related issues

More frequently than quarterly

Please explain

The Vice President ESG reports directly to the CSO. The ESG department plays a crucial role in overseeing the implementation of the Sustainability Commitments 2030, which encompasses water-related aspects. They are responsible for monitoring progress & ensuring alignment with goals and targets related to water stewardship. To stay abreast of water-related developments, the ESG VP and her team actively engage with NGOs, policy makers & trade associations. This allows them to keep a close watch on emerging topics & trends in the water domain. In regular meetings with the CSO or Sustainability Office in general, which take place at least twice a month & more frequently, the VP of ESG provides comprehensive briefings on sustainability matters. Water-related topics are a part of the agenda regularly. The CSO is updated on internal and external developments related to water, such as ongoing political discussions, as well as the progress within the company aligned with water-related targets.

W6.4

(W6.4) Do you provide incentives to C-suite employees or board members for the management of water-related issues?

	Provide incentives for management of water-related issues	Comment
Row 1	Yes	Incentives to all Managing Board members for the management of climate-related issues are provided. Several Board members have further Sustainability-related incentives, and 6 Board members have explicit water-related incentives. Personal target agreements on water for other C-suite employees or similar are agreed upon, if it fits into the job profile.

W6.4a

(W6.4a) What incentives are provided to C-suite employees or board members for the management of water-related issues (do not include the names of individuals)?

	Role(s) entitled to incentive	Performance indicator	Contribution of incentives to the achievement of your organization's water commitments	Please explain
Monetary reward	Board/Executive board Chief Operating Officer (COO) Chief Procurement Officer Chief Purchasing Officer (CPO) Chief Sustainability Officer (CSO)	Reduction of water withdrawals – direct operations Reduction in water consumption volumes – direct operations Reduction of water withdrawal and/or consumption volumes – supply chain Improvements in water efficiency – direct operations Improvements in water efficiency – supply chain	The remuneration system of the Managing Board is aligned with the Group strategy. By selecting appropriate performance criteria for the variable remuneration, incentives (monetary rewards in form of a bonus) are given to implement the Group strategy and to promote the long-term and sustainable development of Heidelberg Materials (both short-term and long- term incentive plans). Both financial and non- financial performance criteria are used to represent the company's success. The	Sustainability is an important component of Managing Board remuneration through a water management component in the variable remuneration of 6 (out of 9) board members. Pay for performance and the focus on the sustainable and long- term development of the company are central principles of the remuneration of its Managing Board. With these principles in mind, 71% of the target direct remuneration for the Chairman of the Managing Board and

W6.5

(W6.5) Do you engage in activities that could either directly or indirectly influence public policy on water through any of the following?

Yes, direct engagement with policy makers Yes, trade associations

Yes, other

W6.5a

(W6.5a) What processes do you have in place to ensure that all of your direct and indirect activities seeking to influence policy are consistent with your water policy/water commitments?

Our policy engagement includes issues covering water conservation as well as water management in the manufacturing of our products. At EU level, we have actively supported the nature restoration law, with the objective of restoring 20% of European seas by 2030, and almost all degraded ecosystems by 2050. We continue to engage in discussions with European Parliament members and communicated publicly our strong support. In addition, we have joined the Global Water Partnership that promotes the effective, efficient & sustainable management of water resources. To ensure effective representation, our Public Affairs team plays a vital role keeping our representatives well-informed about our company's position and the positions held by organizations we engage with. A dedicated water expert directly reports to the VP ESG and coordinates all association & political outreach activities with Group Government Affairs & Association Management. We have also published our updated Water Policy in February 2023 that strengthens the role of a strict water management and sets group guidelines applicable to all country organisations globally. The policy has been approved by the board of directors. Our Public Affairs staff also playes a significant role in the development of the Sustainability Commitments 2030 recently, which include water. This dual role ensures alignment between our public affairs activities & our water strategy, maintaining consistency across our sustainability efforts.

W6.6

(W6.6) Did your organization include information about its response to water-related risks in its most recent mainstream financial report?

Yes (you may attach the report - this is optional)

HC Water Policy_EN_NEW.pdf

UHM_Annual_and_Sustainability_Report_2022.pdf

W7. Business strategy

W7.1

(W7.1) Are water-related issues integrated into any aspects of your long-term strategic business plan, and if so how?

	Are water- related issues integrated?	Long- term time horizon (years)	Please explain
Long-term business objectives	Yes, water- related issues are integrated	5-10	We have integrated various water issues into our long- term business goals, including water scarcity, flood risks, severe weather events related to water, and access to drinking water, sanitation, and hygiene (WASH). To align our efforts with water-related challenges, we have committed to water as part of our 2030 Sustainability Commitments. These commitments focus specifically on improving water management at our facilities in water-risk areas. Our goal is to develop comprehensive water management plans and implement water recycling systems. In addition, we have already taken other water management measures and programs behind our SC2030, such as giving surplus quarry water to local communities or building water reservoirs to capture rainwater. This document includes our targets and key performance indicators. By setting 2030 as the target year for these commitments, we are creating a strategic long-term perspective for addressing water issues. Therefore, a timeframe of 5-10 years was chosen to ensure sufficient planning and implementation. This decision was made in response to projected water shortages, as we want to be responsible and proactive in managing this resource. In addition, achieving a positive net water balance in certain areas not only helps improve community relations, but also ensures the sustainability of our operations by maintaining our permit to operate. Building positive relationships with communities is critical to the continuity of our business efforts.
Strategy for achieving long-term objectives	Yes, water- related issues are integrated	5-10	Our strategy includes comprehensive integration of water issues, including water, sanitation, and hygiene (WASH), and managing risks related to water. To guide our sustainable behaviour and long-term strategy, we have formulated our Sustainability Commitments 2030 with an updated and accelerated version launched in February 2023. These commitments serve as a fundamental framework for addressing ESG issues. As part of SC2030, we have set specific commitments on water, supported by measurable key performance indicators. Water-related aspects integrated into our strategy comprise various elements. These include

			monitoring water resources, reducing freshwater consumption, implementing water conservation, and recycling measures, conducting local risk and opportunity assessments, and providing WASH services that address the link between water and health. Our global strategy is implemented at country level, where environmental managers coordinate plant-level efforts. These initiatives are consistent with our broader long- term goals as we recognize the critical importance of sustainability to our core business. Our 5–10-year time horizon aligns with the UN Sustainable Development Goals. By integrating water issues into our strategy, we mitigate risks, cut costs, and maintain our license to operate. We collaborate with internal & external water experts, regularly reviewing KPIs, engaging with stakeholders, and leveraging partnerships to drive our water strategy.
Financial planning	Yes, water- related issues are integrated	5-10	We recognize that successful implementation requires appropriate financial planning and consideration of water issues across our operations. Water-related issues specific to our operations, such as maintenance of clinker coolers & other equipment with water components, are already integrated into our financial planning. We ensure that the necessary resources are allocated to these operational water measures. We are actively working to improve our financial planning process to address water risks more comprehensively. As part of the EU taxonomy reporting requirements, we have established a CapEx category of water to track & sustain any water investment. In line with the recommendations of the Task Force on Nature-related Financial Disclosures, we are strengthening our approach to incorporating identified water-related risks and opportunities into our long-term financial planning & capital allocation processes. The LEAP approach allows us to account for associated costs & take action to anticipate projected increases in water pressures. The choice of a 5–10-year time horizon is based on the recognition that achieving all of the water-related targets outlined in SC2030 will require ongoing investments beyond 2030. In formulating SC2030, we have taken into account additional costs & cost savings resulting from the measures to be implemented. As a result, water issues are integrated into our financial planning process to ensure adequate resource allocation to meet our commitments.

W7.2

(W7.2) What is the trend in your organization's water-related capital expenditure (CAPEX) and operating expenditure (OPEX) for the reporting year, and the anticipated trend for the next reporting year?

Ro	Row 1				
	Water-related CAPEX (+/- % change)				
	Anticipated forward trend for CAPEX (+/- % change) 3				
	Water-related OPEX (+/- % change)				
	1				

Anticipated forward trend for OPEX (+/- % change)

3

Please explain

To adapt to the EU taxonomy reporting requirements, we have in 2022 adjusted our internal CapEx and OpEx reporting to enable us to track water related costs. As this is the first year that we are able to do the breakdown at this level of granularity a comparison with the last year is not possible. The year-on-year increase is therefore an estimation as is the outlook. We expect that with an increased internal and external awareness for water quality, scarcity and water risks, a higher proportion of investments and operating costs will be linked to water. In 2022 we had ca. 100 different CapEx investments related to water, for example to improve drainage systems, install new washing equipment in our aggregates business or new water-cooling installation in our cement plants. OpEx is mainly related to maintenance of existing equipment and installations to ensure the regular operations of our production.

W7.3

	Use of scenario analysis	Comment
Row 1	Yes	In accordance with the Task Force on Climate-related Financial Disclosures definition, risks encompass both physical risks and transition risks. To evaluate these risks, we take into account current risk potentials and recognized Representative Concentration Pathways (RCP) scenarios provided by the Intergovernmental Panel on Climate Change (IPCC) for the periods up to 2030 and 2050. These scenarios include RCP 2.6 (optimistic), RCP 4.5 (stabilization), and RCP 8.5 (pessimistic).

(W7.3) Does your organization use scenario analysis to inform its business strategy?

For water, we conduct assessments of water risks at each site, projecting the conditions expected by 2030. This assessment is performed using a business-as-usual scenario, considering potential water risks. We also use the WRI Aqueduct tool, which provides insights. By leveraging scenario analysis and tools we gain a comprehensive understanding of climate and water-related risks allowing the company to develop effective strategies and take appropriate actions to address and mitigate risks proactively.

W7.3a

(W7.3a) Provide details of the scenario analysis, what water-related outcomes were identified, and how they have influenced your organization's business strategy.

W7.4

(W7.4) Does your company use an internal price on water?

Row 1

Does your company use an internal price on water?

No, but we are currently exploring water valuation practices

Please explain

We recognize the importance of context-based water targets and consider the implementation of water valuation methods to assess the value of water resources. This exploration reflects our commitment to responsible water management & the potential inclusion of water-related considerations in our decision-making processes. While we are actively exploring, the use of shadow prices for water remains a potential option for the future. The implemented internal carbon dioxide price, aligned with regional targets serves as an orientation and guideline. This price influences the assessment and prioritization of capital expenditure projects, ensuring compliance with environmental considerations. It plays a vital role in financial assessments, including new installations and capacity expansions in the Cement business. By integrating this internal CO2 price, we address our environmental impact and foster sustainable decision-making.

W8. Targets

W8.1

(W8.1) Do you have any water-related targets? Yes

W8.1a

(W8.1a) Indicate whether you have targets relating to water pollution, water withdrawals, WASH, or other water-related categories.

	Target set in this category	Please explain
Water pollution	No, but we plan to within the next two years	In our processes no fresh water is contaminated. We take all possible compliance measures which we ensure by drawing up and implementing water management plans. We also pursue the goal of ensuring that all plants have water recycling facilities, which also improves water quality avoiding any contamination. The water management plans pursued as part of our water strategy further address the corresponding water quality tailored to the individual plants. Quality standards for water discharged into surface- or groundwater bodies must comply with our standards (e.g. license to operate/permits). During all of these processes, we continuously strive to prevent pollution. As the production process in quarries and gravel pits does not chemically alter the water that is used there, these sites contain no pollutants. As part of the Water Management Plans, countries are increasingly concerned with water pollution and ways to counteract it.

Water withdrawals	No, but we plan to within the next two years	A quantitative target aimed at reducing water use by a certain percentage can be problematic in areas with limited water resources. If water availability is already scarce, further reductions could lead to significant disruptions in water supply and fail to meet the needs of people as we transfer surplus or treated water to third parties. In India, where we have an externally audited water positivity score of 6.59. We have also distanced ourselves from a quantitative water reduction target for the time being in order to take regional differences in terms of climate and water resources into account. A rigid target that applies equally to all areas could be inappropriate and lead to unrealistic and unachievable targets balanced by water-rich countries that are not a sustainable solution. It is therefore important for us not to pursue a quantitative measures such as water recycling systems.
Water, Sanitation, and Hygiene (WASH) services	Yes	
Other	Yes	

W8.1b

Achieved

Please explain

Implementation of the WBCSD's WASH Commitment is a target of our Sustainability Commitments 2030, i.e., to implement access to clean water, sanitation, and hygiene at the Access to clean water, sanitation, and hygiene at the workplace at an appropriate level for all employees in all of our controlled operations within three years of signing (signing in 2018). The target applies company-wide, as all employees are affected. We believe that providing safe WASH services at all our sites is a shared value, so it is groupe-wide for all employees. Implementing the WASH Pledge represents an investment in a healthier and more productive workforce, as health and safety (H&S) is our top priority. This is crucial, as our quarrying and cement and concrete production activities depend on healthy relationships with local communities, where most of our employees also come from. Since 2018, we have conducted annual company-wide selfassessments using the WBCSD self-assessment questionnaire with defined indicators and thresholds. It is rolled out through the H&S managers in each country, coordinated by the Environmental Social Governance department and the Global H&S Manager. In accordance with the WBCSD methodology, we consider the target to have been met as all of our facilities met the Pledge requirements and achieved at least a score of 1.8 on the assessment by implementing improvement actions at previously non-compliant sites in 2021 and 2022, to achieve compliance.

Revised

Please explain

In 2022, Heidelberg Materials updated and accelerated its Sustainability Commitments 2030, including the water targets and strategy, which was externally launched in February of 2023. The target of having all sites equipped with Water Management Plans was revised and strengthen recently.

Water Management Plans (WMPs) are composed of different parts: They include a Water Flow Diagram, which is a graphical representation of the water flow indicating whether water is estimated or measured. Further, a Water Monitoring Plan is part of the WMP which adds descriptive components on water withdrawal, applied measurements or qualified estimation methods that need to be supported by technical drawings or maps, and eventually the:

- identification of local water risks and opportunities

- implementation of water consumption reduction and efficiency measures
- development and implementation of engagement with local stakeholders
- implementation of water protection measures
- the assessment of site-specific freshwater reduction targets

Last year, we began introducing and testing WMPs in a number of countries. By the end of 2025, we aim to implement WMPs in the individual plants in all regions with water scarcity, by 2027 in all regions with water stress, and eventually by 2030 in all regions with water risk. We will focus on actively training and educating the sites to achieve this target. Based on the data we collect through the WMPs, we can assess which country-or region-specific freshwater reduction targets are both ambitious and achievable and where further actions and measures must be taken.

W9. Verification

W9.1

(W9.1) Do you verify any other water information reported in your CDP disclosure (not already covered by W5.1a)?

Yes

HM_Annual_and_Sustainability_Report_2022.pdf

W9.1a

(W9.1a) Which data points within your CDP disclosure have been verified, and which standards were used?

Disclosure module	Data verified	Verification standard	Please explain
W1 Current state	We have conducted verification of water consumption figures for the cement business line, including absolute quantities and specific consumption per tonne of cement and clinker. Additionally, we have verified total water withdrawal and discharge. As per GCCA definitions, total water withdrawal refers to the cumulative amount of water drawn into the organization's boundaries from various sources, while water discharge encompasses the volume of water released through different channels. Water consumption is calculated by subtracting total water discharge from total water withdrawal.	ISAE 3000	The data has undergone independent limited assurance by PwC, following the International Standard on Assurance Engagements (ISAE) 3000 (Revised). The definitions used are based on the methodology of the Global Cement and Concrete Association (GCCA).

W10. Plastics

W10.1

(W10.1) Have you mapped where in your value chain plastics are used and/or produced?

	Plastics mapping	Value chain stage	Please explain
Row 1	Yes	Direct operations	Direct operations: Although, we do not primarily use plastic, we use waste material as alternative fuels, and these materials could

	Supply	contain plastics substances:
	chain	- Waste materials coming from waste treatment, which can be from
		municipal site waste treatment or even commercial industrial
		treatment.
		- Industrial waste from the manufacture of secondary material for
		plastic. Since this is a not usable and not recyclable material, this is
		also categorized as waste
		- Supply chain: We are already using 100% paper bags in the vast
		majority of our markets. Only in very few countries we are using
		plastic bags and are permanently assessing cost-efficient and
		environment-friendly alternatives.

W10.2

(W10.2) Across your value chain, have you assessed the potential environmental and human health impacts of your use and/or production of plastics?

	Impact assessment	Value chain stage	Please explain
Row 1	Yes	Direct operations Supply chain	Direct operations: In general, the use of waste incl. plastic requires a permit, and environmental impact assessment at country level. To successfully be able to use waste in our processes, we must ensure that communities are not affected by the use of alternative fuels. Supply chain: As part of our initial risk assessment of material categories that we procure, we assess commodities that contain plastics such as plastic packings and the impact of their production on environment. The assessment is done based on environmental and social criteria that include but not limited to water, energy, biodiversity, H&S, waste, etc. As a result of this initial risk assessment we identify high risk suppliers, that are subject to external sustainability assessment by our partners "IntegrityNext" and "Avetta".

W10.3

(W10.3) Across your value chain, are you exposed to plastics-related risks with the potential to have a substantive financial or strategic impact on your business? If so, provide details.

	Risk exposure	Please explain
Row	No, risks	A potential challenge with the use of alternative fuels in the future could
1	assessed, and	be that the content and composition of the waste could lead to different

none considered	heat generation, partly due to the plastic content. However, we do not see
as substantive	this as a risk, but rather as an assessable change that has no impact on
	our business. We see the trend that recycling, and recovery of plastics is
	increasing, so there are fewer plastics in the final waste. Our overall water
	and climate impact focus on the usage of biogenic alternative fuels, and
	we are not dependent on in any way on plastics.

W10.4

(W10.4) Do you have plastics-related targets, and if so what type?

	Targets in place	Please explain
Row	No – and we do	We are not pursuing a plastic target because we want to continue to use
1	not plan to within	waste as an alternative fuel, and the content of plastic on it depends on the
	the next two	waste treatment, we aim to have high content of biogenic fuels, which is
	years	independent from plastic content. Basically, we don't aim to use plastic as
		such, but only alternative fuels.

W10.5

(W10.5) Indicate whether your organization engages in the following activities.

	Activity applies	Comment
Production of plastic polymers	No	not applicable for our industry
Production of durable plastic components	No	not applicable for our industry
Production / commercialization of durable plastic goods (including mixed materials)	No	not applicable for our industry
Production / commercialization of plastic packaging	No	not applicable for our industry
Production of goods packaged in plastics	No	In principle, we are increasingly distancing ourselves from plastic packaging and use paper bags for the vast majority.
Provision / commercialization of services or goods that use plastic packaging (e.g., retail and food services)	No	not applicable for our industry

W11. Sign off

W-FI

(W-FI) Use this field to provide any additional information or context that you feel is relevant to your organization's response. Please note that this field is optional and is not scored.

(W11.1) Provide details for the person that has signed off (approved) your CDP water response.

	Job title	Corresponding job category
Row	Chief Sustainability Officer (CSO)/Member of the Managing	Board/Executive board
1	Board	

SW. Supply chain module

SW0.1

(SW0.1) What is your organization's annual revenue for the reporting period?

	Annual revenue
Row 1	21,100,000

SW1.1

(SW1.1) Could any of your facilities reported in W5.1 have an impact on a requesting CDP supply chain member?

No, CDP supply chain members do not buy goods or services from facilities listed in W5.1

SW1.2

(SW1.2) Are you able to provide geolocation data for your facilities?

	Are you able to provide geolocation data for your facilities?	Comment
Row 1	No, not currently but we intend to provide it within the next two years	

SW2.1

(SW2.1) Please propose any mutually beneficial water-related projects you could collaborate on with specific CDP supply chain members.

SW2.2

(SW2.2) Have any water projects been implemented due to CDP supply chain member engagement?

No

SW3.1

(SW3.1) Provide any available water intensity values for your organization's products or services.
